Introduction

Our aim is to create a lexical inventory of Urum, a non-documented and not previously described language of the Minor Caucasus. For this purpose, we used a list of concepts to be elicited in the object language by means of translation. Our expectation from this list is to obtain a inventory of lexical items representing a broad range of fields of language communication. On the basis of this material we expect to estimate the consistency of the lexicon of this virtually unknown language and to identify the lexical input from the involved contact languages (i.e., Russian, Turkish, Georgian, and Greek) as well as the extend to which the object language is intelligible with the languages in its environment.

Why we use word-list translation? Given that there is no available text collection in the object language in order to establish a lexical inventory by observational means, our methodological choices are restricted to those methods that allow for collecting lexical material from scratch. Beyond word-list translation, there are at least two methods that are popular in field linguistics.

The first possibility is to elicit lexical material through the presentation of extra-linguistic stimuli (pictures or videos). This method have been effectively explored for semantic fields that allow for visual representation, e.g., colour terms (see Berlin and Kay 1969), spatial relations (see Levinson 2003) or several types of artefacts (see Bowern 2008: 107f.). The main advantage of the use of extra-linguistic stimuli is that it excludes interferences from the contact language. However, it shares with translation a number of common problems: picture-elicitation is based on an *a priori* determined inventory of concepts, and the product of elicitation is a laboratory (i.e., non-naturalistic) dataset. In contrast to translation, the product of picture description is less controlled, i.e., the obtained data may contain a substantial amount of variation with respect to the choice of concepts or with respect to the morphosyntactic environment. Furthermore, picture description has the crucial limitation that it can be only applied for a very restricted subset of the lexical inventory, namely for those concepts that may be visually represented.

A further possibility is to collect lexical material by asking the native speaker for the concepts that are contained by a particular field, e.g. "tell me the names of fruit and vegetables you grow and eat" (Mosel 2006: 76). The most important merit of this approach to field lexicography is that it allows for insights into the relevance of the particular concepts in the specific language and culture. In comparison to word-list or picture elicitation, this

method does not restrict the collected inventory to a list of *a priori* selected concepts. However, the collected material is less controlled (concerning morphosyntactic variation) and is subject to the limitations of the recall competence of the native speakers. Most crucially, it is not clear whether this method can be applied for the elicitation of a full list of lexical concepts (there are no attempts to create an global lexical inventory by means of this type of questions).

Elicitation by word-list translation has the main merit that it is a highly controlled method. As any other method, the use of translation comes with a number of limitations. Some of these limitations can be circumvented through appropriate adaptations of the elicitation procedure. Some other limitations are inherent to the methodological approach and imply that particular types of generalizations are not permissible in datasets obtained by this kind of method, i.e., they are only possible if translation will be complemented by other means of observing lexical properties (see discussion in Section 3).

2. Method

2.1. Inventory of concepts

The basis for our inventory is the word list of the World Loanword Database/WOLD (see Haspelmath and Tadmor 2009). Our inventory involves some marginal deviations from the original list: we removed some concepts that are unknown in the cultural environment of the Urum people and added other concepts that are of substantial cultural relevance. Terms corresponding to the Caucasian flora and fauna as well as to the traditional food and spices in Georgia have been added from Roudik (2009: 3-4; 128-137). Efy Yordanoglu added a set of concepts that are of particular relevance for the Greek minority of Turkey. The final inventory contains 1419 concepts classified in 24 semantic fields following the classification of the WOLD database, see Table 1.

2.2. Elicitation procedure

Since elicitation of citation forms is not possible, the target concepts were inserted in sentential frames, according to rules depending on the type of concept (entity, event, property, event property, function word), as illustrated in (1). The sentential frames were translated in Russian, which was the contact language in the field sessions.

(1)   Target concept: goat
       Sentential frame: The goat is clever.
       Contact language (Russian):   Коза умная.

   The sentential frames were created with the following rules.

(2)   *Non-relational concepts* are encoded (in the stimulus) as subjects.
       Target concept: goat
       Sentential frame: The goat is beautiful.

(3)   *Relational concepts* are encoded (in the stimulus) as subjects possessed by a 3rd person.
       Target concept: nose
       Sentential frame: His nose is beautiful.

(4)   *Properties* and *events* are encoded (in the stimulus) as predicates.
       (a)   Target concept: big

7

	Sentential frame:	This thing is big.
(b)	Target concept:	wake up
	Sentential frame:	Maria wakes up.

The native speakers were instructed as follows:

(5) Instruction:

I will present you a sentence in Russian. Imagine that you are speaking to an Urum speaker and try to express the very same message in your language. Do not worry if you need to use words from foreign languages for this purpose. Just express this message spontaneously as you would do in speaking with another Urum speaker.

The entire inventory of sentential frames was collected with four native speakers in order to allow for a preliminary estimation of the between-subject variation. The elicited translations are given in the lexicon as 'sp-1', 'sp-2', 'sp-3', and 'sp-4' respectively.

3. Methodological limitations of the translation

A. A-priori lexical inventories

An inherent problem of this methodological approach is that the lexical inventory is determined *a priori*, i.e., on the basis of considerations that do not originate in the object language. Some fields, e.g., ethnobotany, kinship terminology, terms of ritual life etc., are highly cultural specific, but virtually any lexical field is idiosyncratic in every language, which implies that there is no way to predict the range of relevant concepts in any language by compiling an inventory in another language. A partial solution to this problem is to include concepts applying to the particular environment to the language-independent list, as we have done for terms from flora, fauna and food (see Section 2.1). However, the essence of the problem remains, since the representativity of the obtained dataset for the object language is still not guaranteed. Concepts of particular relevance for the language community will be missing because they are not contained in the inventory in the contact language. The best way to fill these gaps is to add material from naturalistic data, i.e., spontaneous text production.

B. Semantic extension

It is obvious that the product of a word-list translation is a bilingual list of translational equivalents on the basis of the contextualization provided through the sentential frames. The obtained dataset contains singular instances of the use of the words in the context provided by the translation. These observations have exactly the same limitation with singular

observations in corpora: it is not possible to draw generalizations about the semantic extension of a lexical item by means of singular observations of its occurrence (see discussion and illustrative examples in Haviland 2006: 136). There is only one aspect of semantic extension that can be discovered through word-list translations: the case that *one* lexical unit in the object language corresponds to n (>1) lexical units in the contact language.

C. Citation forms

A word list is a set of lexical items of the contact language in their citation form. Ideally the product of word-list translation would be a list of the translational equivalents of the object language in the citation form. However, citation forms are not linguistic entities but scientific abstractions for the representation of lexical knowledge. Hence, a translation from citation form to citation form involves a large amount of meta-linguistic assumptions that should be avoided with linguistically naïve native speakers. For this purpose and in order to avoid variation from the random spontaneous selection of morphosyntactic forms of the lemma, we embedded our material in sentential frames, as illustrated in Section 2.2.

D. Between-subjects variation

Between-subject variation may be crucial, either in the individual ability to translate elements from a source to a target language or with respect to the proper linguistic properties of the object language (e.g., variation in the phonological or phonetic realization of the items). For this purpose, it is important to obtain a minimum of repeated observations – at least to make sure that the obtained data are not the product of an idiolect and to have a preliminary estimation of the locus of between-subjects variations in the language.

E. Interferences from the contact language

This is an inherent problem of the translation approach. The only possibility to control effects of interferences is the comparison with naturalistic data.

F. Metalinguistic procedures

Translation is a meta-linguistic activity, hence the process of lexical choice in the production of a translational equivalent may involve additional procedures, e.g., normative assumptions of the native speaker about the "correct" translation or the "proper" form of lexical items. Such processes are not limited to translation data but occur in any laboratory type of language production as well as in several types of naturalistic language production. We should be aware that we are recording a particular register that is selected by the native speaker for the particular discourse occasion. We should be aware that there are certainly further registers in

the object language as well as that the register we are recording certainly occurs elsewhere too, i.e., it is not invented by the native speaker for the particular occasion of translating for a linguist.

4. Transcriptions

There is no established orthography (no writing tradition at all) for the Urum language and there is not yet a linguistic analysis of the phonological system. The transcriptions of the the collected data were made by Violeta Moisidi following a convention adopted by our project. The development of a normed convention based on phonological contrasts is a future aim.

5. Data and audio files

The data was collected in Tbilisi, October-November 2010. Our inventory was translated by Angelina Angelova, Agafangel Turshiev, Elena Demurcheva, and Gerakl Konstantinidi. The audio files of the sentences are available in the database of the Urum documentation project. The file names are compiled by the codes that are given in each lemma (e.g., UUM-LEX-01-22200-0X) by replacing 'X' with the number of the speaker (1 to 4).
